Computer Science — DSA: Graph Algorithms

Quick offline notes (study-ready formulae + key ideas):

BFS visits by layers: shortest path in unweighted graphs
DFS explores deep first; useful for cycles and topological sort
Topological sort works for DAGs
Edge cases: disconnected graphs and isolated nodes
Complexity: O(V+E) typical for BFS/DFS
Use visited/parent to reconstruct paths

Tip: open the PDF and try 3 practice questions from your course notes.
